The Integrated Visual Augmentation System (IVAS) is a revolutionary technology that provides soldiers with a 360-degree view of their surroundings, including the ability to see through walls and around corners. This system is designed to enhance situational awareness and reduce the risk of friendly fire incidents.

ous IVAS Capability Set (CS) 4 testing. Based on results of the Operational Demonstration (Ops Demo), the Army is adjusting the IVAS acquisition and fielding strategy. The Army is currently testing the IVAS system in various operational environments, including urban and rural areas. The results of these tests will be used to refine the system and determine the best way to integrate it into existing military operations. The Army is also working on developing new capabilities for the IVAS system, such as the ability to identify and track threats.

Intravascular ventricular assist system (iVAS) is an investigative device in clinical trials for the management of advanced heart failure. It works on the principle of counterpulsation, similar to the classic intra-aortic balloon counterpulsation (IABP). The iVAS system is designed to provide continuous counterpulsation to the heart, which helps to improve blood flow and reduce the workload on the heart. This device is being tested in a clinical trial to determine its safety and effectiveness in treating patients with advanced heart failure. The results of this trial will be used to determine if the iVAS system is a viable treatment option for these patients.
